LotLens

What would Massachusetts Question 7 actually change on your street?

Project brief, analysis, use cases, app flow, and dataset guide

Event: Hackachusetts 2026 (SundAI, Tough Tech Week) · **Track:** Civic action
Prepared: October 24, 2026 · **Vote on Question 7:** Tuesday, November 3, 2026
Build tools: Kiro + GitHub · **Team size:** up to 4

In one sentence: LotLens takes free public data on Massachusetts land, zoning, sewers, and aerial imagery and turns it into a simple, neutral tool where anyone can type an address and see what they can build there today, what they could build if Question 7 passes, whether that is realistic, and what it means for their town.

Contents: 1. Executive summary · 2. Why this topic · 3. Question 7 explained · 4. Scale and impact · 5. The product · 6. All use cases · 7. App flow · 8. Multimodal design · 9. Eligibility logic and methodology · 10. Datasets · 11. Technical architecture · 12. Hackathon build plan · 13. Demo script · 14. Risks · 15. Prior work and differentiation · 16. After the vote · Appendix A: News articles · Appendix B: Dataset links

1. Executive summary

Massachusetts voters decide Question 7 on November 3, days after the hackathon. It would cap minimum lot sizes for single-family homes at 5,000 square feet on land with public water and sewer and at least 50 feet of street frontage. It is described as the first zoning reform ever put directly on a state ballot, and housing cost is the top issue for voters this cycle.

Yet voters have little to go on. The two main estimates of new homes differ by up to 16x, and recent polls disagree sharply. No widely available tool shows what Question 7 means for a specific lot or neighborhood. LotLens fills that gap using parcel-level public data plus a computer-vision “reality check” on aerial imagery.

Key fact	Value	Source
Minimum lot under Q7	5,000 sq ft, with public water + sewer and ≥50 ft frontage	Sec. of State, WBUR
Parcels whose rules Q7 would govern	~850,000	Tufts cSPA
Parcels gaining real new options	~200,000 (mostly large lots that could be split, some vacant)	Tufts cSPA
New homes per year (Tufts)	~750 central estimate; plausible range 350–1,200	Tufts cSPA
New homes per year (campaign)	2,200–5,700	Legalize Starter Homes via WBUR
State housing need	~222,000 units by 2035	CommonWealth Beacon
Single-family land with ≥40,000 sq ft minimum	More than half	National Zoning Atlas
Recent polls	Suffolk/Globe: ~41% yes, ~41% no · UMass/WCVB: ~65% yes, ~21% no	Boston Globe; Banker & Tradesman

Recommendation: Build LotLens for 5–10 contrasting Metro Boston towns. Core features: address lookup (today’s rule vs. Q7 rule), town impact map, and an aerial-imagery reality check. Stretch: sewer overlay and a neutral Q&A with both sides’ arguments.

2. Why this topic

We compared the hottest Massachusetts topics in late October 2026 on two criteria: how trending they are and how much usable data exists. Housing and Question 7 scored highest on both.

Topic	How hot	Data richness	Detail level	Multimodal fit	Political risk
Q7 / housing (LotLens)	Very high: vote Nov 3	Very high	Every parcel	Strong (maps, tables, aerial images, text)	Medium (handled by neutral design)
Winter energy emergency	Very high: declared Oct 5	High	Census tract	Moderate	Low
License plate cameras (Flock)	Very high	Medium, patchy	Camera / department	Moderate	Medium

Topic	How hot	Data richness	Detail level	Multimodal fit	Political risk
MassHealth work requirements	High: start Jan 2027	Medium	Region	Some (letters)	Medium
School enrollment decline	Moderate	High	District	Low	Low

Why LotLens wins: every core dataset is free, statewide, and available down to individual lots, and the datasets map directly onto Question 7's legal conditions (lot size, sewer and water access, frontage). It also has a natural place for computer vision, which most civic-track projects lack.

3. Question 7 explained

> **Like you're 10:** Every town has a rule about how big your yard must be to build a house. Many towns require roughly a football field of land. Question 7 asks voters whether to shrink that rule to about a basketball court (5,000 sq ft), but only where there are water and sewer pipes. LotLens is a magnifying glass that shows what that change would mean for any yard and any town.

What it would do

- Sets a statewide maximum on minimum lot size: towns could not require more than 5,000 sq ft for a single-family home.
- Applies only where there is public water and sewer service and at least 50 feet of street frontage.
- Removes special permits required solely for qualifying single-family homes in residential districts.
- Towns keep other tools, such as rules on height, setbacks, bulk, open space, and parking.
- A yes vote enacts the change; a no vote leaves the law as it is.

The two sides

Supporters argue	Critics argue
Large minimum lots drive up land cost per home and push builders toward big, expensive houses.	It overrides local planning with one rule for all 351 cities and towns.
Smaller lots allow more modest "starter homes" for young families and downsizing seniors.	Nothing requires the new homes to be small or affordable; large homes can be built on small lots.
Housing cost is the top issue for voters; the state needs ~222,000 more units by 2035.	Existing water and sewer systems may not have capacity for unplanned new homes.
Backed by a broad coalition, including the governor, her Republican challenger, and the attorney general.	The Massachusetts Municipal Association opposes it on local-control grounds.

LotLens takes no side. It presents both arguments and lets the data for each lot and town speak.

4. Scale and impact

Question 7 does not set a number of homes. It changes what is allowed; how many homes get built depends on owners choosing to split land and build. That is why estimates vary so widely.

Estimate	New homes / year	Over 10 years	Share of 222,000 need	Basis
Tufts cSPA (central)	~750	~7,500	~3%	Historical subdivision behavior, zoning codes
Tufts cSPA (range)	350–1,200	3,500–12,000	~2–5%	Same model, uncertainty band
Yes on 7 campaign	2,200–5,700	22,000–57,000	~10–26%	Campaign's own analysis

Who and where

- **Land:** about 850,000 parcels would fall under the new rules; about 200,000 would gain real new options (Tufts).
- **Geography:** Boston-area suburbs with strong sewer infrastructure and large lots would see the biggest increase (Tufts).
- **Towns unaffected:** the campaign expects about 120 municipalities to be unaffected because they lack water and sewer infrastructure.
- **Construction effect:** Tufts estimates roughly +15% single-family construction and roughly +5% overall housing development.
- **Prices:** the median single-family home price rose 10% from 2023 to 2024, to $610,000 (CommonWealth Beacon).
- **People:** no official count exists. As a rough illustration only, ~750 homes/year × ~2.5 people ≈ ~1,900 people housed per year.

The pitch hook: Experts disagree by up to 16x (350 vs. 5,700 homes per year), and polls disagree too. LotLens shows why, parcel by parcel: how many lots qualify on paper, how many already have a house in the way, and how many are realistically buildable.

5. The product

LotLens is a free, no-login web app that works on phones and laptops. Users type an address (or pick a town) and get a plain-language answer to three questions: What can be built here today? What could be built under Question 7? Is that realistic?

Design principles

- **Neutral:** no voting recommendation; both sides' arguments shown with sources.
- **Transparent:** every number links to its dataset; estimates are labeled as estimates with confidence levels.
- **Simple:** one search box and a few taps; no GIS knowledge needed.
- **Private:** never display owner names from assessor data; town views are aggregated.
- **Not legal advice:** clear disclaimer that local rules, wetlands, deeds, and permits can still apply.

6. All use cases

Priority key: **Core** = built at the hackathon · **Stretch** = if time allows · **Future** = post-hackathon roadmap.

User	Their question	What LotLens shows	Priority
Voters	What does Q7 actually do in my town?	Count and map of lots gaining options; both sides' arguments	Core
Homeowners	Could I split my lot or build a second home?	Lot size, today's minimum vs. 5,000 sq ft, sewer/water/frontage checks, paper vs. realistic lots	Core
Neighbors	Could someone build on the big lot next to me?	Nearby qualifying lots with aerial photos	Core
Journalists and researchers	Why do Tufts and the campaign disagree so much?	Breakdown: qualifies on paper → blocked by existing buildings → realistically buildable	Core
Town officials and planning boards	Where could new homes appear, and how many?	Qualifying lots by neighborhood and sewer service area	Stretch
Water and sewer managers	Could new homes strain our system?	Qualifying lots grouped by sewer service area	Stretch
Curious voters	Can I just ask a question?	Plain-English Q&A grounded in the data, with sources	Stretch
Advocates (both sides)	Where is the case for or against strongest?	Same data, filterable by town and lot type	Stretch
First-time buyers and renters	Would this create homes I could afford, and where?	Towns with the most new buildable lots plus land-value context	Future
Seniors looking to downsize	Could smaller homes appear near where I live now?	Qualifying lots in their town and nearby towns	Future
Small builders	Which lots are realistic candidates?	Filter by realistic lots (no owner data)	Future

User	Their question	What LotLens shows	Priority
Real estate agents and appraisers	How might Q7 affect a property's options?	Lot-level option summary	Future
Teachers and students	How does a ballot question affect real places?	Civics lesson mode using a local town	Future
Legislators and policymakers	How would this interact with other reforms?	Scenario comparisons (e.g., duplexes, ADUs)	Future

7. App flow

Five screens. Most users type once (the address) and then tap through.

Screen	What the user does	What they see	Data behind it
1. Search	Types an address or picks a town	Map zooms to the property or town	Parcels, geocoding
2. Your lot	Reads and scrolls	Lot outline; card comparing today's minimum with 5,000 sq ft; checks for sewer, water, 50 ft frontage; "on paper, up to N lots"	Parcels, assessor table, zoning minimums, sewer and water layers
3. Reality check	Taps "Is this realistic?"	Aerial photo cropped to the lot; AI marks house, driveway, trees, open land; verdict like "realistically 1 extra home, not 4"	2023 aerial imagery, building footprints, vision model
4. Your town	Taps "See my town"	Heat map of qualifying lots; counts on paper vs. realistic; top neighborhoods; tap any lot to jump to screen 2	All of the above, aggregated
5. Ask and compare	Types a question	Grounded answer with sources; neutral panel of supporters' and critics' arguments with local numbers	Q7 text, voter guide, Tufts report, town stats, LLM

Example walkthrough (illustrative numbers)

A user types a Lexington address. The lot card shows a 21,000 sq ft lot in a district that currently requires 15,500–30,000 sq ft depending on the neighborhood. Under Q7 the lot passes all three checks, so on paper it could hold up to 4 lots. The reality check finds a house in the middle and mature trees at the back and estimates 1 realistic extra home. The town view shows how many Lexington lots gain options and where. *All numbers in this example are made up; the real app uses actual parcel data.*

8. Multimodal design

Modality	Examples	Role in LotLens
Geospatial	Parcel polygons, sewer and water service areas, zoning districts	Locate the lot; test sewer and water conditions; estimate frontage
Tabular	Assessor records, zoning minimum lot sizes, Tufts benchmarks	Lot size, land use, current minimum, town statistics
Images	MassGIS 15 cm aerial imagery	See what is actually on the land: buildings, pavement, trees, open space
Text	Q7 ballot text, voter guide arguments, Tufts report, zoning bylaws	Grounded Q&A and the neutral both-sides panel

The reality-check pipeline

1. **Map:** load the parcel polygon; confirm it falls inside both a sewer and a water service area.
2. **Table:** pull lot area and the district's current minimum; compute paper lots = floor(area ÷ 5,000), capped by frontage ÷ 50.
3. **Image:** crop the aerial tile to the parcel bounding box, draw the parcel outline, and send it to a vision-capable LLM with a structured prompt.
4. **Structured output:** the model returns JSON, e.g. {building_pct, pavement_pct, tree_pct, open_pct, water_or_wetland_visible, notes}.
5. **Combine:** realistic extra lots = floor(open usable area ÷ 5,000), constrained by frontage and existing structures.
6. **Explain:** the LLM writes a two-sentence plain-English verdict with the numbers it used.

Validation that will impress judges: compare the model's building coverage with MassGIS building footprints for the same lots. Report agreement (for example, mean absolute error in percentage points) on a sample of 50–100 lots. Most hackathon AI projects never measure accuracy; LotLens can show it on one slide.

9. Eligibility logic and methodology

Parcel classification rules (first-pass, documented so judges can follow them):

Step	Rule	Notes
1. Residential use	Keep single-family and vacant residential parcels using assessor use codes	Verify code meanings in MassGIS parcel documentation before relying on them
2. Lot size	Lot area ≥ 5,000 sq ft (assessor acres × 43,560 or polygon area)	Use polygon area as fallback when assessor value is missing
3. Infrastructure	Parcel centroid inside a sewer service area AND a water service area	Sewer layer is a planning-level estimate; flag edge cases
4. Frontage	Approximate street frontage ≥ 50 ft	Approximate from parcel edges adjacent to road right-of-way; mark "needs review" if uncertain

Step	Rule	Notes
5. Is anything new?	Current district minimum > 5,000 sq ft	If the town already allows 5,000 sq ft, Q7 changes nothing for that lot
6. New option type	Vacant and below current minimum → newly buildable; area ≥ 10,000 sq ft → potentially splittable	Matches Tufts' two categories: vacant lots and splittable large lots
7. Paper lots	floor(area ÷ 5,000), capped by floor(frontage ÷ 50)	Upper bound only
8. Realistic lots	From the vision reality check (section 8)	Shown with a confidence label

Known limitations

- Zoning overlays, cluster bylaws, wetlands, conservation restrictions, deed restrictions, and slopes are not fully modeled in the first version.
- Frontage is approximated from geometry; real frontage depends on legal access and lot layout.
- Sewer and water boundaries are estimates for planning purposes; capacity is not modeled.
- Aerial imagery is from spring 2023 (2025 imagery may be available); recent construction may be missing.
- LotLens shows what is allowed and physically plausible, not what will be built; market demand, costs, and owner choices are why Tufts models behavior.
- The supporters' claim that about half of existing single-family homes would not meet their town's current minimum is testable with this data and could be a bonus finding.

10. Datasets

All datasets below are free. MassGIS states its data is public domain (credit appreciated); its 2023 imagery page states no restrictions apply.

Dataset	Publisher	What it gives LotLens	Format / access
Property Tax Parcels	MassGIS	Lot boundaries plus assessor data (lot size, land use, building value)	Download by city/town or statewide request; GIS formats
Estimated Sewer Service Areas	MassDEP / MassGIS	Whether a lot is in a public sewer area; includes parcel counts per area	Polygons; 2025 release (PubV2025_10)
Water Utility Service Areas (WURP)	MassDEP / MassGIS	Public drinking-water service areas (and sewer)	Polygons
MWRA Water/Sewer Service Areas	MWRA / MassGIS	Town-level water/sewer codes for MWRA communities (backup check)	Polygons; codes WS / W / S / N
2023 Aerial Imagery	MassGIS	15 cm statewide leaf-off color imagery for the vision check	JPEG 2000 tiles or tile service
2023 Imagery Tile Index	MassGIS	Find which tile covers a parcel; download links	Polygon index with URLs
Building Structures (2-D)	MassGIS	Building roofprints over 150 sq ft; validates the vision model	Polygons; updated with 2019–2023 imagery

Dataset	Publisher	What it gives LotLens	Format / access
National Zoning Atlas: Massachusetts	National Zoning Atlas	Minimum lot sizes by zoning district; statewide context	Interactive map and report
MAPC Zoning Atlas	Metropolitan Area Planning Council	Comparable zoning data for 101 Metro Boston municipalities	Web atlas with download page
Tufts cSPA Q7 analysis	Tufts University	Benchmark estimates (850k / 200k parcels; 750 homes/yr)	Report
Official Q7 text and arguments	Secretary of the Commonwealth	Ballot text, yes/no meanings, official arguments for both sides	Web page
American Community Survey	U.S. Census Bureau	Household size, income, housing context by tract/town	Tables / API

Optional extras: MassDEP wetlands layers (search the MassGIS data catalog), street-level imagery, and town zoning bylaw PDFs for the Q&A.

11. Technical architecture

Layer	Approach
Preprocessing (before or early in the day)	Python + GeoPandas: load parcels for chosen towns, join assessor table, spatial-join zoning minimums, sewer and water areas; compute frontage and eligibility; export compact GeoJSON or vector tiles per town.
Storage	Static files in the repo (GeoJSON per town + a town summary JSON). No database needed for the demo.
Frontend	Single-page web app with an open-source map library (e.g., MapLibre or Leaflet); address search; lot card; town heat map.
Imagery	Crop from the MassGIS 2023 tile service by parcel bounding box; cache crops for demo lots.
AI	Vision-capable LLM for the reality check (structured JSON output); text LLM for grounded Q&A over Q7 text, voter guide, Tufts summary, and town stats. AWS Bedrock is a natural fit given the AWS sponsorship.
Build workflow	Kiro for spec-driven development; repo connected to GitHub as the rules require; README with data sources and methodology.

12. Hackathon build plan

Scope

- 5–10 contrasting Metro Boston towns with sewer service (candidates: Newton, Needham, Wellesley, Lexington, Framingham, Quincy). Confirm each town's minimums and sewer coverage first.
- Pre-select 5 demo lots that show different outcomes: big change, small change, no change (already small lots), no sewer, and blocked by existing house.
- A polished demo on a few towns beats a shaky statewide version.

Timeline (hacking 11:30 AM to 8:00 PM deadline)

Time	Goal
11:30–12:00	Repo set up in Kiro and connected to GitHub; load prepared data
12:00–1:00	Eligibility pipeline and town summary numbers working
1:00–2:30	Map, address search, and lot card working
2:30–4:00	Vision reality check on demo lots; footprint validation sample
4:00–5:00	Town heat map; Q&A and both-sides panel (stretch)
5:00–5:45	Integration and testing on the 5 demo lots
5:45–6:15	README, screenshots, short demo video
6:15–7:30	Submit the SundAI project card with the correct GitHub repo, well before the 8 PM deadline

Team roles (up to 4)

Role	Owns
Data engineer	Parcels, zoning, sewer/water joins, eligibility logic, town stats
Vision / ML lead (Sushma)	Imagery cropping, vision prompts and JSON schema, footprint validation
Frontend	Map, search, lot card, town view, mobile layout
Product / LLM / pitch	Q&A grounding, both-sides panel, README, demo script, submission

Pre-event checklist

- Confirm in the rules whether downloading datasets before the event is allowed (code usually must be written on the day).
- Download parcels, sewer, and water layers for the chosen towns; record each town's minimum lot sizes.
- Test the imagery tile service on a few Boston-area parcels.
- Pick the 5 demo lots and check that none display owner names.
- Bring student ID and the Sundai QR code; collect the Kiro credit code at check-in.

13. Demo script (about 2.5 minutes)

Time	Beat
0:00	Hook: “Days before the vote, polls disagree and experts disagree by 16x. Most voters have never seen what Question 7 means for their own street.”
0:20	Type a real demo address. Show the lot card: today’s minimum vs. 5,000 sq ft, three checks, “on paper, up to N lots.”
0:50	Tap reality check. Aerial photo with AI markings and the verdict: paper vs. realistic.
1:20	Town view: heat map and counts; compare the paper vs. realistic totals with the Tufts range.
1:50	Ask a question; show the neutral both-sides panel with local numbers.
2:10	Validation slide: vision vs. building footprints accuracy.
2:25	Close: free public data, neutral by design, useful whichever way the vote goes.

14. Risks and mitigations

Risk	Mitigation
Seen as advocacy on a live ballot question	No recommendation; both sides with sources; no endorsements shown; neutral language reviewed by the team
Inaccurate numbers	Label estimates; show confidence; validate vision against footprints; compare totals with Tufts
Frontage and zoning complexity	Conservative rules; “needs review” flags; scope to base-district minimums
Privacy	Never show owner names; aggregate in town view; demo lots chosen carefully
Mistaken for legal advice	Clear disclaimer on every lot card
Running out of time	Preprocess data; limit towns; cache imagery and AI results for demo lots
API or imagery outage during demo	Pre-cached crops and recorded backup video

15. Prior work and differentiation

Existing work	What it does	How LotLens differs
Tufts cSPA analysis and MyBallot app	Statewide estimates; summaries of every ballot question	Address-level and town-level view; explains the estimate gap visually
National Zoning Atlas / MAPC Zoning Atlas	Maps zoning districts and rules	Applies Q7’s conditions to individual parcels and shows the change
Campaign analysis	Higher estimates of new homes	Neutral; shows paper vs. realistic capacity
Realtor and news price analyses	Examples of small-lot prices	Systematic, data-backed, and interactive

We did not find a public tool that applies Question 7’s rules parcel by parcel with an imagery-based reality check, though a limited search cannot prove none exists.

16. After the vote

- **If Q7 passes:** LotLens becomes a map of where homes can now legally be built; add permit tracking to see what actually gets built.

- **If Q7 fails:** LotLens documents what was at stake and supports the continuing zoning debate in towns and on Beacon Hill.
- **Extensions:** scenarios for related reforms (for example, a legislative proposal to allow duplexes by right, which Tufts researchers noted could compound Q7’s effects), ADUs, and the MBTA Communities Act; statewide coverage; price and affordability layers.
